ADDRESSING COMMON PERINATAL MENTAL HEALTH DISORDERS IN LOW- AND MIDDLE-INCOME COUNTRIES

A Silent Burden No More

INTRODUCTION

Nearly one billion people globally live with some form of mental illness, and 80% of them reside in low- and middle-income countries (LMICs). The inequality continues with treatment access. It has been estimated that up to 90% of people who need mental health treatment in LMICs are not receiving it. Women bear a particular burden, especially during the perinatal period. Common perinatal mental disorders (CPMDs), including prenatal and postpartum depression, anxiety, and somatic disorders, are the leading complications of pregnancy and childbirth globally. About one in five women in LMICs suffer from one or more CPMD. The pressing need to address perinatal mental health (PMH) globally has gained attention in recent years, particularly as the COVID-19 pandemic further worsened mental health outcomes for women during pregnancy, childbirth, and the postpartum period, and in light of the ongoing maternal mortality crisis.

FINDINGS FROM A LANDSCAPE ANALYSIS ON PMH IN LMICS

To better understand the state of PMH in LMICs, and interventions implemented to address women’s PMH needs, in 2021, the U.S. Agency for International Development (USAID)-funded MOMENTUM Country and Global Leadership project conducted a landscape analysis, “The Silent Burden: Common Perinatal Mental Disorders in Low- and Middle-Income Countries.” It explored the prevalence of CPMDs, risk factors for CPMDs, and interventions to address identified mental health issues and support women and families. It also highlighted some of the gaps—in research and implementation—when trying to address the PMH needs of women and girls globally.
PMH Landscape Analysis: Key Themes

- CPMDs have significant and lasting implications for women’s health and quality of life.
- CPMDs have been associated with adverse development in newborns and children.
- Women in LMICs are at greater risk for CPMDs if exposed to multiple risk factors, such as negative experiences with the health system, obstetric trauma, perinatal loss, and poor social support.
- PMH should be integrated across sectors, within and outside of health, away from centralized institutions to the primary health center and community level, and into health worker education and practice.
- Future research should include findings from different contexts, avoid generalizations, generate more evidence for vulnerable populations, expand beyond postnatal depression, center the expressed desires of women, and explore integrated approaches for women’s and children’s health.

The landscape analysis found that CPMDs pose significant and lasting implications for women’s and children’s health and quality of life. Women with a history of postpartum depression had a 25% risk of a recurrence in a subsequent pregnancy; postpartum depression is a major risk factor for maternal death by suicide, accounting for 20% of mortality in the year after childbirth.8,9 PMH conditions have also been associated with adverse physical, emotional, and neurological development in newborns and children.10 Studies from LMICs found that depressed mothers had a higher risk of preterm births and low-birthweight babies.11 The presence of CPMDs in mothers also appears to increase the risk of stunting and wasting in children.12 (The full impact of CPMDs on both maternal and newborn/child health outcomes is outlined in Figure 1.) There also appears to be an association between CPMDs and the extent to which mothers seek immunization services or care for ill children.

In terms of implementation strategies and existing programs, the landscape analysis identified the successful core components of PMH interventions at both the community and facility levels. At the community level, stepped care, detailed context assessments, task-sharing models, and talk therapy were identified. At the health facility level, core components included pre-service training on mental health, trained and supervised providers, referral and assessment processes, mental health support for providers, provision of respectful care, and linkages with gender-based violence services. Despite these successful implementation approaches, significant gaps remain in understanding how to address CPMDs, which further illuminates an urgent need to provide CPMD prevention and care to women in LMICs.
GIVING VOICE TO THE SILENT BURDEN: THE PMH TECHNICAL CONSULTATION

In September 2021, MOMENTUM Country and Global Leadership, in collaboration with the World Health Organization and United Nations Population Fund, facilitated a three-day technical convening on PMH in LMICs, entitled “Giving Voice to the Silent Burden: Maternal Mental Health Technical Consultation.” This interactive, virtual event brought together 689 participants from 89 countries who are members of the maternal, newborn, child health, nutrition, faith, humanitarian, and mental health communities to collaborate and inform the path forward for PMH to ensure that pregnant and postpartum women, and their families, receive the respectful and nurturing care they need and deserve.

Panelists, speakers, and participants focused on populations that particularly need to be reached by PMH programming, such as adolescents, families experiencing perinatal loss, and women living in humanitarian settings. They further explored the available evidence and some of the challenges in implementing programs for PMH with fidelity and at scale. Key discussions included an overview of the global burden of CPMDs, current evidence on effective interventions, considerations for vulnerable populations and those at increased risk for CPMDs, country experiences introducing and scaling up PMH programs, integrating mental health care into existing service delivery platforms, strengthening provider capacity to deliver PMH care, and the role of community, civil society, and faith organizations in supporting mental health.
CO-CREATING A PMH THEORY OF CHANGE AND SET OF PRIORITIZED IMPLEMENTATION RESEARCH QUESTIONS

The technical consultation led to a clear call for a common global vision and framework for PMH programming, as well as a shared PMH research agenda, behind which the mental health, maternal mental health, and maternal, newborn, and child health communities could coalesce. These collaborative conversations led to the engagement of a human-centered design partner, Quicksand, from May to July 2022 to support a co-creation process. This process resulted in 1) a prioritized list of implementation research questions and 2) a global PMH theory of change.

FIGURE 2: PMH IMPLEMENTATION RESEARCH QUESTIONS ALONG THE PMH IMPLEMENTATION PATHWAY

PHASE 1: LISTEN
- What PMH promotion, prevention, and care and treatment interventions/services do women, communities, and health workers want in communities and facilities?
- What outcomes are meaningful to these groups?

PHASE 2: CO-DESIGN
- How do we work with implementers and beneficiaries to translate their insights into co-designed PMH interventions?
- How can we partner with women and communities to effectively translate these insights into contextualized mental health advocacy and literacy messages that result in more women seeking PMH care and support?

PHASE 3: PREPARE
- What inputs are needed across the health system to integrate PMH interventions into existing routine care in communities and facilities?

PHASE 4: IMPLEMENT
- What are the most effective strategies for integrating PMH prevention, care and treatment interventions into existing primary health care (PHC) systems?
- How can these strategies be adapted to different contexts and implementation realities while maintaining high quality, respectful care?

PHASE 5: SUSTAIN
- How can health systems successfully sustain PMH interventions over time?

THROUGHOUT: LEARN & ADAPT
- How can we effectively use insights from women, communities, and health workers for continuous learning and adaptation?
Following the prioritization of the PMH implementation research questions, and with support from Quicksand and the PMH steering committee, MOMENTUM facilitated the development of a PMH theory of change (Annex A). The theory of change was organized according to the layers of the social ecological model, which outlines the broad illustrative interventions and outcomes at each layer, and a shared vision or goal for PMH. This theory of change provides essential guidance for well-coordinated and designed programming and can serve as the basis for future metrics and implementation guidance. The theory of change includes a package of resources for global use.

**PMH IMPLEMENTATION RESEARCH AND COUNTRY PROGRAMS**

Now, in 2023, the MOMENTUM team is starting to plan for PMH implementation research in India. Working to build on the progress and work to date, the team will explore strategies for implementing high-quality, integrated PMH programs at scale, and to expand the evidence base in response to the prioritized questions in Figure 2. Focusing on the subdistrict level, MOMENTUM proposes to integrate PMH programming into existing platforms and programs at the facility and community levels to understand implementation challenges. This implementation research scope will start to address the question of how to practically integrate PMH prevention, promotion, care, and treatment interventions into existing primary health care systems. Implementation research will start with a co-creation process with partner Quicksand and a diverse set of stakeholders to define a set of user-centered interventions and then implementation and evaluation of the interventions in select facilities and communities.

Additional PMH efforts at the country level include the following:

**Nigeria:** The MOMENTUM team in Nigeria hosted a maternal mental health dialogue in November 2022. Sixty participants, including the director of reproductive health division, the head of safe motherhood in the reproductive health division, and the national coordinator of mental health, engaged with a panel of practitioners and researchers in maternal mental health and committed to eight solutions. These solutions include integrating maternal mental health services into existing services, mainstreaming services into primary health care using the Basic Health Care Provision Fund, and allocating adequate funding provision for research on PMH.

**Cambodia:** MOMENTUM, in partnership with the Ministry of Health, will begin work to strengthen mental health services for survivors of the Khmer Rouge through the existing primary health care system. Given MOMENTUM’s experience with the PMH analyses, conducting qualitative research and co-creating research agendas and a theory of change for mental health (and incorporating the social determinants), the MOMENTUM PMH team was asked to contribute to the work plan and strategize on how best to support the integration of mental health services into existing health and social services. MOMENTUM will continue to support project implementation as the scope of work is defined with Cambodia’s Ministry of Health.

**ESTABLISHING A COUNTRY-LED PMH COMMUNITY OF PRACTICE**

In June 2023, MOMENTUM facilitated the launch of a PMH community of practice (CoP). The PMH CoP serves as a global collaborative platform for experts and practitioners working in maternal health, newborn health, mental health, and related fields. It is intended for program implementers, researchers, and those with lived experiences to learn from each other and enhance their knowledge of PMH in LMICs. The community provides an opportunity for those living and working in LMICs to share practical and effective tools and best practices, and to coordinate capacity-strengthening efforts related to PMH.
The PMH CoP strives to create a dynamic and inclusive environment for its members to collaborate in the following ways:

- Connect individuals who have an interest in enhancing and advocating for PMH prevention, care, and treatment in LMICs.
- Disseminate the latest evidence, lessons learned, and implementation guidance.
- Share program achievements, challenges, and outstanding questions to harness the power of a global community for peer learning, collaboration, and collective problem solving.

ANNEX A. GLOBAL PMH THEORY OF CHANGE

The Global PMH ToC
A common framework that can guide global thinking, investments, and programming when trying to improve the access and quality of care for PMH services.*

INDIVIDUAL

Prevention: Comprehensive maternal health care for all women of reproductive age, which includes support for mental health services, and sexual rights.

Provide evidence-based psychological interventions through existing platforms.

One-stop solution for building awareness and behaviour change communication around mental health.

All women, regardless of age and context, receive targeted support that protects their mental health and wellbeing, including access to specialized PMH care across the promotion, prevention, and treatment continuum.

INTERPERSONAL RELATIONSHIPS

Engage women and partners directly in conversations around mental health.

Couples communicate effectively and practice non-violent conflict resolution around PMH decisions.

CMH and stakeholders are able to identify and provide quality support and referrals for PMH care in a timely manner.

COMMUNITY

Conduct sociologic and demographic campaigns, strengthen community resiliency and communication through social media, and media campaigns to summarize and address challenges with perinatal mental health, and care seeking.

Integrate comprehensive PMH programming, support, and referral activities, existing community-led platforms, and other peer support networks.

SERVICE DELIVERY ECOSYSTEM

Use adapted and validated CPMSs, including measurement tools for women during individual and group ANC/CPM and healthcare interactions.

POLICY LANDSCAPE

POWERS, knowledge, and authority toushed to communities to lead PMH services.

PMH advocacy and policy support and training, including capacity options, to health workers to advance their own mental health needs.

Governments and civil society organizations, dedicated resources, enact policies, are accountable for, and effectively implement PMH services to ensure health and rights of all women, children, and families.

POWERS, knowledge, and authority to pushed to communities to lead PMH services.

PMH advocacy and policy support and training, including capacity options, to health workers to advance their own mental health needs.

Governments and civil society organizations, dedicated resources, enact policies, are accountable for, and effectively implement PMH services to ensure health and rights of all women, children, and families.

*Due to space constraints, this Theory of Change does not include outputs.

IMPACT

Improved PMH and wellbeing through promotion, prevention, early identification, care, and treatment, resulting in better health outcomes for all women, children, and families.
Addressing Common Perinatal Mental Health Disorders In Low- and Middle-Income Countries:
